Abstract

This website is used to buy and sell flowers online. created using different languages such as: Html , CSS , PHP , MySql

2 Introduction

This website is used to buy and sell flowers online. It contains registration screen to enter user information for the first time, login screen with validation to check if user register before or not, then the home screen contains 4 parts : (About us, Our products, Reviwes , Contact us), Cart screen to submit or edit the order, Database contains 4 tabels (Users, Cart, Products, Messages)

3 Features

- Allow users to create accounts by providing necessary information.
- Ensure secure storage of user data in the "Users" database table.
- Implement validation checks to prevent duplicate registrations.
- Provide a login screen with authentication to verify user identity.
- Display information about the website, its mission, and team.
- Allow users to read and leave reviews for products.

4 Prerequisites

- Git for version control.
- Local server software like XAMPP.
- IDE like VS code.
- Database management system like MySql.

5 How it works

- Users access the registration screen to create a new account, They provide necessary information such as username, password, email, etc.
- If the credentials are correct, the user is authenticated and gains access to their account.
- Users can browse through the products, view images, and access product details.

- Users can add desired flowers to their shopping cart, The shopping cart screen allows users to review and edit the contents of their cart.
- Users proceed to the checkout process to submit their orders securely.

6 User interface

- Input fields for the user to enter registration details (username, password, email, etc.), Buttons to submit the registration form, Error messages for invalid input.
- Fields for entering the username/email and password, Buttons for logging in, Error messages for incorrect login attempts.
